

AMENDMENTS TO THE CLAIMS

Please amend claims 1, 2 and 10. A complete listing of the claims, showing their current status, is provided below.

1. (Currently Amended) A method for generating an addressable array of chemical moieties on a substrate, comprising:
 - (a) depositing the moieties onto different regions of the substrate so as to fabricate the array;
 - (b) before the array is exposed to a sample, saving in a memory array related data which comprises any of machine readable ~~an~~ instructions for use by a processor on how to ~~reading~~ an array or machine readable ~~an~~ instructions for use by a processor on how to ~~processing~~ data from an array following reading of the array;
 - (c) shipping the fabricated array, and forwarding the array related data to a location remote from where the array is fabricated.
2. (Currently Amended) A method for generating an addressable array of chemical moieties on a substrate, comprising:
 - (a) depositing the moieties onto different regions of the substrate so as to fabricate the array;
 - (b) before the array is exposed to a sample, saving in a memory array related data which comprises any of machine readable ~~an~~ instructions for use by a processor on how to ~~reading~~ an array or machine readable ~~an~~ instructions for use by a processor on how to ~~processing~~ data from an array following reading of the array, which array related data is saved in association with an identifier so that the array related data can be retrieved from the memory using the identifier;
 - (c) shipping the fabricated array, and forwarding the array related data to a location remote from where the array is fabricated.
3. (Canceled)
4. (Previously Presented) A method according to claim 2 wherein the chemical moieites are biopolymers.

5. (Original) A method according to claim 4 wherein the biopolymers are DNA.
6. (Previously Presented) A method according to claim 2 wherein the memory is a database, the method additionally comprising retrieving the array related data from the memory and communicating the retrieved data to location remote from the database in response to receiving a communication of the associated identifier from the remote location.
7. (Previously Presented) A method according to claim 2 wherein the memory comprises a portable storage medium, the method additionally comprising shipping the portable storage medium to a location remote from where the array is fabricated.
8. (Original) A method according to claim 7 wherein the portable storage medium is shipped to the same remote location as the array.
9. (Previously Presented) A method according to claim 6 additionally comprising applying a communication address to the substrate or a housing carrying the substrate, which communication address identifies a location from which the array related data will be communicated in response to a received communication of the identifier in association with which the array related data was saved.
10. (Currently Amended) A method of generating, at a central fabrication station, addressable arrays of chemical moieties on multiple substrates, comprising at the central fabrication station for each array:
 - ~~(a)~~(b) depositing biopolymers onto different regions of a substrate so as to fabricate multiple arrays;
 - ~~(b)~~(e) before the array has been exposed to a sample, saving in a memory array related data which comprises any of an machine readable instructions for use by a processor on how to reading an array, or an machine readable instructions for use by a processor on how to processing data from a read array following reading of the array, which array related data is saved in association with an identifier so that the array related data can be retrieved from the memory using the identifier;
 - ~~(c)~~(d) applying the identifier to the substrate carrying the array or a housing carrying that substrate; and

(d) shipping each of the fabricated arrays with applied identifier to one or more of locations each remote from the central fabrication station.

11. (Previously Presented) A method according to claim 10 wherein the biopolymers are polynucleotides.

12. (Previously Presented) A method according to claim 11 wherein the polynucleotides are DNA.

13. (Previously Presented) A method according to claim 10 wherein the memory is a database, the method additionally comprising retrieving array related data for arrays from the memory and communicating the data to locations remote from the database in response to receiving a communication of associated identifiers from the remote locations.

14. (Previously Presented) A method according to claim 10 wherein for each of multiple arrays the array related data and identifier for that array are saved on a memory comprising a portable computer readable storage medium, the method additionally comprising shipping the portable storage mediums to multiple locations remote from the central fabrication station.

15. (Previously Presented) A method according to claim 14 wherein each of the portable storage mediums are shipped with the fabricated array for which the portable storage medium carries array related data and the identifier, to a same location remote from the central fabrication station from which a set of biopolymers used in fabricating that array was received.

16. (Previously Presented) A method according to claim 10 additionally comprising applying a same communication address to each of the substrates or housings carrying the substrates, which communication address identifies a location from which array related data will be communicated in response to a received communication of the identifier saved in association with the array related data.

17. – 44 (Canceled)

45. (Previously Presented) A method according to claim 1 wherein the array related data includes an indication as to whether a particular type of control probe is present on the array.

46. (Previously Presented) A method according to claim 2 wherein the array related data includes an indication as to whether a particular type of control probe is present on the array.
